ABSTRACT

Published records of benthic marine green (Chlorophyta) macroalgae from tropical and subtropical Australia are systematically listed with full bibliographic details and collection localities. Two hundred and ten taxa are listed, with references to the original description and, where one could be found, an illustration of each also given.

CHECKLIST AND BIBLIOGRAPHY OF BENTHIC MARINE
MACROALGAE RECORDED FROM NORTHERN AUSTRALIA

III. CHLOROPHYTA

1. INTRODUCTION

This report is the final of three reports which systematically collate published records of benthic marine macroalgae from northern Australia. Remarks on the need for this series were made in the introductions to the earlier lists; in essence, a need to collate the numerous species lists scattered through the literature into a single series of publications and so clearly establish the existing algal record. This report on the green algae, together with that on the red (Lewis 1984) and brown algae (Lewis 1985), fulfil this need and also aim to aid in the identification of the listed taxa.

2. FORMAT

The format is the same as that of Parts I and II. The region covered by the checklist extends from the New South Wales-Queensland border on the eastern coastline (Lat. 28°10'S) around the northern coastline to North-West Cape in Western Australia (Lat. 21°48'S). Norfolk and Lord Howe Islands off the east coast are also included. All collection localities cited in the text are shown in Figure 1.

For each species record, full bibliographic details and the collection locality or localities are given. Where recorded names have been reduced to synonymy with other species they are recorded as such, but full synonymies have not been attempted. Dubious records, as for example those of typically southern Australian taxa, are indicated by an asterisk. To aid in the future identification of species, full references to original species descriptions are given and, where one could be found, a reference to an illustration of each species.

The systematic arrangement follows Wynne and Kraft (1981).

3. ACKNOWLEDGEMENTS

I am indebted to Dr Peter Saenger for checking through the manuscript and alerting me to several errors and omissions.
